

# 300mA Dual LDO Regulator with POR

## General Description

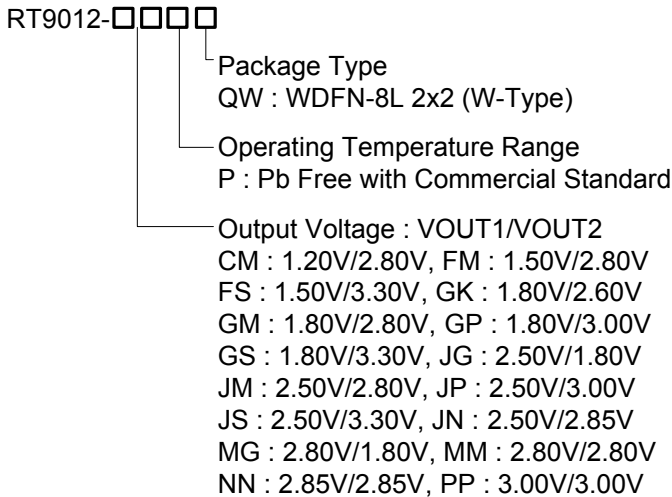

RT9012 is a dual channel, low noise, and low dropout with the sourcing ability up to 300mA and power-on reset function. The range of output voltage is from 1.2V to 3.6V by operating from 2.5V to 5.5V input.

RT9012 offers 2% accuracy, extremely low dropout voltage (240mV @ 300mA), and extremely low ground current, only 27µA per LDO. The shutdown current is near zero current which is suitable for battery-power devices. Other features include current limiting, over temperature, output short circuit protection.

RT9012 is short circuit thermal folded back protected. RT9012 lowers its OTP trip point from 165°C to 110°C when output short circuit occurs (VOOUT < 0.4V) providing maximum safety to end users.

RT9012 can operate stably with very small ceramic output capacitors, reducing required board space and component cost. RT9012 is available in fixed output voltages in the WDFN-8L 2x2 package.

## Ordering Information

Note :

RichTek Pb-free products are :

- ▶RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶Suitable for use in SnPb or Pb-free soldering processes.
- ▶100% matte tin (Sn) plating.

## Features

- Wide Operating Voltage Ranges : 2.5V to 5.5V
- Low-Noise for RF Application
- No Noise Bypass Capacitor Required
- Fast Response in Line/Load Transient
- TTL-Logic-Controlled Shutdown Input
- Low Temperature Coefficient
- Dual LDO Outputs (300mA/300mA)
- Ultra-low Quiescent Current 27µA/LDO
- High Output Accuracy 2%
- Short Circuit Protection
- Thermal Shutdown Protection
- Current Limit Protection
- Short Circuit Thermal Folded Back Protection
- Tiny 8-Lead WDFN Package
- RoHS Compliant and 100% Lead (Pb)-Free

## Applications

- CDMA/GSM Cellular Handsets
- Battery-Powered Equipment
- Laptop, Palmtops, Notebook Computers
- Hand-Held Instruments
- PCMCIA Cards
- Portable Information Appliances

## Marking Information

For marking information, contact our sales representative directly or through a RichTek distributor located in your area, otherwise visit our website for detail.

Typical Application Circuit

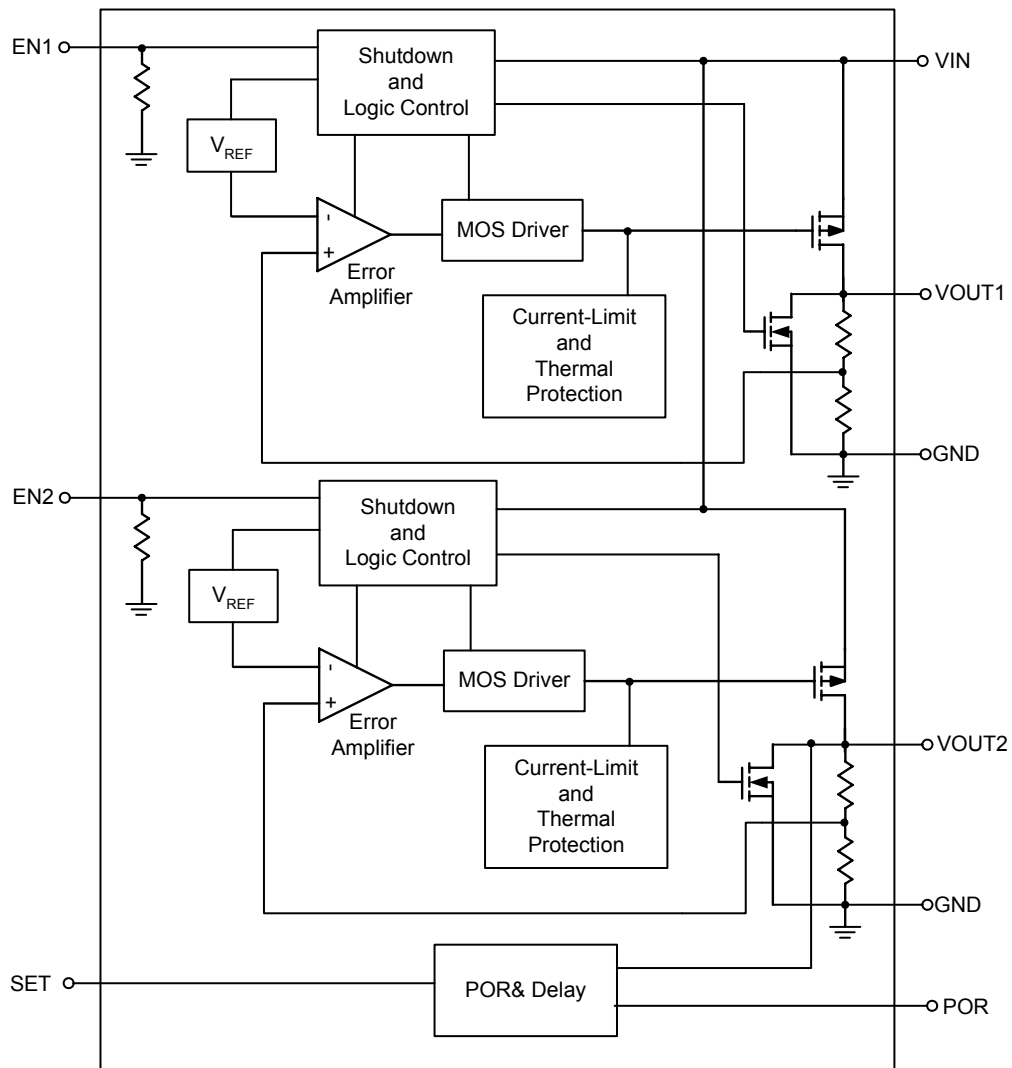

Functional Pin Description

Pin No.	Pin Name	Pin Function
1	VIN	Supply Input
2	EN1	Chip Enable1 (Active High)
3	EN2	Chip Enable2 (Active High)
4	SET	Delay Set Input. Connect external capacitor to GND to set the internal delay.
5	GND	Common Ground
6	POR	Power-On Reset Output : Open-drain output. Active low indicates an output under-voltage condition on regulator 2.
7	VOUT2	Channel 2 Output Voltage
8	VOUT1	Channel 1 Output Voltage
Exposed Pad	GND	Exposed pad should be soldered to PCB board and connected to GND.

Available Voltage Version

<b>Voltage</b>	C	F	W	G	D	Y	H	E	J	K	T

**Note 1.** Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

**Note 2.** Devices are ESD sensitive. Handling precaution recommended.

**Note 3.** The device is not guaranteed to function outside its operating conditions.

**Note 4.**  $\theta_{JA}$  is measured in the natural convection at  $T_A = 25^\circ C$  on a low effective thermal conductivity test board of JEDEC 51-3 thermal measurement standard.

**Note 5.** The dropout voltage is defined as  $V_{IN} - V_{OUT}$ , which is measured when  $V_{OUT}$  is  $V_{OUT(NORMAL)} - 100mV$ .

### Applications Information

Like any low-dropout regulator, the external capacitors used with the RT9012 must be carefully selected for regulator stability and performance. Using a capacitor whose value is  $> 1\mu\text{F}$  on the RT9012 input and the amount of capacitance can be increased without limit. The input capacitor must be located a distance of not more than 0.5 inch from the input pin of the IC and returned to a clean analog ground. Any good quality ceramic or tantalum can be used for this capacitor. The capacitor with larger value and lower ESR (equivalent series resistance) provides better PSRR and line-transient response.

The output capacitor must meet both requirements for minimum amount of capacitance and ESR in all LDOs application. The RT9012 is designed specifically to work with low ESR ceramic output capacitor in space-saving and performance consideration. Using a ceramic capacitor whose value is at least  $1\mu\text{F}$  with ESR is  $> 20\text{m}\Omega$  on the RT9012 output ensures stability. The RT9012 still works well with output capacitor of other types due to the wide stable ESR range. Figure 1. shows the curves of allowable ESR range as a function of load current for various output capacitor values. Output capacitor of larger capacitance can reduce noise and improve load transient response, stability, and PSRR. The output capacitor should be located not more than 0.5 inch from the VOUT pin of the RT9012 and returned to a clean analog ground.

Figure 1. Stable Cout ESR Range

### Thermal Considerations

Thermal protection limits power dissipation in RT9012. When the operation junction temperature exceeds  $170^\circ\text{C}$ , the OTP circuit starts the thermal shutdown function and turns the pass element off. The pass element turn on again after the junction temperature cools by  $40^\circ\text{C}$ . RT9012 lowers its OTP trip level from  $170^\circ\text{C}$  to  $110^\circ\text{C}$  when output short circuit occurs ( $V_{\text{OUT}} < 0.4\text{V}$ ) as shown in Figure 2. It limits IC case temperature under  $100^\circ\text{C}$  and provides maximum safety to customer while output short circuit occurring.

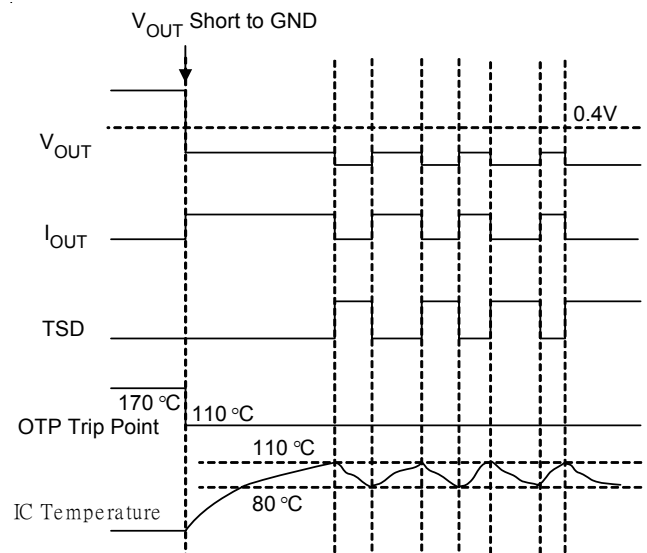

Figure 2. Short Circuit Thermal Folded Back Protection when Output Short Circuit Occurs (Patent)

For continuous operation, do not exceed absolute maximum operation junction temperature  $125^\circ\text{C}$ . The power dissipation definition in device is :

$$P_D = (V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{OUT}} + V_{\text{IN}} \times I_Q$$

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction to ambient. The maximum power dissipation can be calculated by following formula :

$$P_{D(\text{MAX})} = (T_{J(\text{MAX})} - T_A) / \theta_{JA}$$

Where  $T_{J(\text{MAX})}$  is the maximum operation junction temperature  $125^\circ\text{C}$ ,  $T_A$  is the ambient temperature and the  $\theta_{JA}$  is the junction to ambient thermal resistance.

For recommended operating conditions specification of RT9012, where  $T_{J(MAX)}$  is the maximum junction temperature of the die ( $125^{\circ}\text{C}$ ) and  $T_A$  is the operated ambient temperature. The junction to ambient thermal resistance ( $\theta_{JA}$  is layout dependent) for WDFN-8L 2x2 package is  $108^{\circ}\text{C}/\text{W}$  on the standard JEDEC 51-3 single-layer thermal test board. The maximum power dissipation at  $T_A = 25^{\circ}\text{C}$  can be calculated by following formula :

$$P_{D(MAX)} = ( 125^{\circ}\text{C} - 25^{\circ}\text{C} ) / 108 = 0.926\text{W for WDFN-8L 2x2 packages}$$

The maximum power dissipation depends on operating ambient temperature for fixed  $T_{J(MAX)}$  and thermal resistance  $\theta_{JA}$ . For RT9012 packages, the Figure 3 of derating curves allows the designer to see the effect of rising ambient temperature on the maximum power allowed.
