

4-Channel Charge Pump White LED Driver with Low Dropout Current Source

General Description

The RT9368 is a high efficiency and cost effective charge pump white LED driver. It supports up to 4 white LEDs with regulated constant current for uniform intensity. The RT9368 maintains the highest efficiency by utilizing a x1/x1.5/x2 charge pump and low dropout current regulators.

User can easily configure each LED current from 1.25mA to 20mA by a PWM dimming control. The dimming of white LEDs current can be achieved by applying a PWM signal to the EN pin.

RT9368 is available in a WQFN 3x3-16L package.

Ordering Information

Note :

RichTek Pb-free products are :

- ▶RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶Suitable for use in SnPb or Pb-free soldering processes.
- ▶100% matte tin (Sn) plating.

Marking Information

For marking information, contact our sales representative directly or through a RichTek distributor located in your area, otherwise visit our website for detail.

Features

- Very High Efficiency Over 80% of Battery Life
- Support up to 4 White LEDs
- Support up to 80mA Output Current
- 1% Typical LED Current Matching
- Soft Start Function
- Auto Charge Pump Mode Selection
- 250kHz Fixed Frequency Oscillator
- Output Over Voltage Protection
- PWM Dimming Control
- Low Input Noise and EMI
- RoHS Compliant and 100% Lead (Pb)-Free

Applications

- Mobile Phone, DSC, MP3
- White LED Backlighting
- LCD Display Supply

Note 1. Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2. Devices are ESD sensitive. Handling precaution is highly recommended.

Note 3. The device is not guaranteed to function outside its operating conditions.

Note 4. θ_{JA} is measured in the natural convection at T_A = 25°C on a low effective thermal conductivity test board of JEDEC 51-3 thermal measurement standard.

Applications Information

The RT9368 is a high efficiency charge pump white LED driver. It provides 4 channels low dropout voltage current source to regulated 4 white LEDs current. For high efficiency, the RT9368 implements x1/x1.5/x2 mode charge pump. An external R_{SET} is used to set the current of white LED. RT9368 has input current regulation to reduce the input ripple.

Soft Start

The RT9368 includes a soft start circuit to limit the inrush current at power on and mode switching. Soft start circuit holds the input current level long enough for output capacitor C_{OUT} reaching a desired voltage level. When the soft start off, the RT9368 won't sink spike current from V_{IN} .

Mode Decision

The RT9368 uses a smart mode decision method to select the working mode for maximum efficiency. Mode decision circuit senses the output and LED voltage for up/down selection.

Dimming Control

When an external PWM signal is connected to the EN pin, brightness of white LED is adjusted by the duty cycle.

LED Current Setting

The current of white LED connected to RT9368 can be set by R_{SET} . Every current flows through the white LED is 250 times greater than the current of R_{SET} . The white LED can be estimated by following equation :

$$I_{LED} = \left(\frac{V_{SET}}{R_{SET}} \right) \times 250$$

Where $V_{SET} = 1.2V$, and R_{SET} is the resistor connected from ISET to GND.

If the LED is not used, the LEDs pin should be connected to GND. Figure 4 shows the connection for 3LEDs application, LED4 pin is connection to GND directly.

Figure 4. Application for 3 LEDs

Layout Consideration

The RT9368 is a low dropout current source for white LED driver. Careful PCB layout is necessary. For best performance, place all peripheral components as close to the IC as possible. A short connection is highly recommended. The following guidelines should be strictly followed when designing a PCB layout for the RT9368.

- ▶ All the traces of LED pins running from chip to LEDs should be wide and short to reduce the parasitic connection resistance.
- ▶ Input capacitor (C_{IN}) should be placed close to V_{IN} (Pin 5) and connected to ground plane. The trace of V_{IN} in the PCB should be placed far away the sensitive devices or shielded by the ground.
- ▶ The GND should be connected to a strong ground plane for heat sinking and noise protection.
- ▶ The connection of R_{SET} should be isolated from other noisy traces. The short wire is recommended to prevent EMI and noise coupling.
- ▶ Output capacitor (C_{OUT}) should be placed close to V_{OUT} and connected to ground plane to reduce noise coupling from charge pump to LEDs.
- ▶ 6. The traces running from pins to flying capacitor should be short and wide to reduce parasitic resistance and prevent noise radiation.
